Contents:

webchk is a command-line tool developed in Python 3 for checking the HTTP status codes and response headers of URLs. It accepts one or more URLs as arguments. Furthermore, a sitemap URL can be passed using the `-p` option to download its content, extract the URLs and check their statuses.

## 1.1 Installation

webchk is available on PyPI and can be installed using pip with the following command:

```
$ pip install webchk
```

Webchk does not require any 3rd party packages to run. So it can also be cloned from GitHub and run as a module:

```
$ git clone https://github.com/amgedr/webchk.git
$ cd webchk
$ python3 -m webchk
```

## 1.2 Usage

```
webchk [-h] [-i INPUT] [-o OUTPUT] [-p] [-a] [-l] [-s] [-f] [-v]
        [urls [urls ...]]
```

```
positional arguments:
  urls
```

(continues on next page)

(continued from previous page)

```
optional arguments:
  -h, --help                show this help message and exit
  -i INPUT, --input INPUT  Read input from a file
  -o OUTPUT, --output OUTPUT Save output to a file
  -p, --parse               Follow links listed in .xml URLs
  -l, --list                Print URLs without checking them
  -v, --version            Print the version number
```

## 1.2.1 Examples

Check a list of URLs from a file (one URL per line):

```
$ webchk -i urls.txt
```

Check the status of a sitemap file and all the URLs listed in it:

```
$ webchk -p http://example.com/sitemap.xml
```

List the URLs in a file without checking their HTTP status:

```
$ webchk -li urls.txt
```

Check the URLs in a file and .xml files in it:

```
$ webchk -pi urls.txt
```

List the URLs in a file and .xml files in it:

```
$ webchk -pli urls.txt
```

List the URLs in a sitemap without checking their status:

```
$ webchk -lp http://example.com/sitemap.xml
```

## 2.1 Stable release

To install webchk, run this command in your terminal:

```
$ pip install webchk
```

This is the preferred method to install webchk, as it will always install the most recent stable release.

If you don't have `pip` installed, this [Python installation guide](#) can guide you through the process.

## 2.2 From sources

The sources for webchk can be downloaded from the [Github repo](#).

You can either clone the public repository:

```
$ git clone git://github.com/amgedr/webchk
```

Or download the [tarball](#):

```
$ curl -OL https://github.com/amgedr/webchk/tarball/master
```

Once you have a copy of the source, you can install it with:

```
$ python setup.py install
```

## CHAPTER 3

---

### Usage

---

To use webchk in a project:

```
import webchk
```

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways:

## 4.1 Types of Contributions

### 4.1.1 Report Bugs

Report bugs at <https://github.com/amgedr/webchk/issues>.

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

### 4.1.2 Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” and “help wanted” is open to whoever wants to implement it.

### 4.1.3 Implement Features

Look through the GitHub issues for features. Anything tagged with “enhancement” and “help wanted” is open to whoever wants to implement it.

## 4.1.4 Write Documentation

webchk could always use more documentation, whether as part of the official webchk docs, in docstrings, or even on the web in blog posts, articles, and such.

## 4.1.5 Submit Feedback

The best way to send feedback is to file an issue at <https://github.com/amgedr/webchk/issues>.

If you are proposing a feature:

- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.
- Remember that this is a volunteer-driven project, and that contributions are welcome :)

## 4.2 Get Started!

Ready to contribute? Here's how to set up *webchk* for local development.

1. Fork the *webchk* repo on GitHub.
2. Clone your fork locally:

```
$ git clone git@github.com:your_name_here/webchk.git
```

3. Install your local copy into a virtualenv. Assuming you have virtualenvwrapper installed, this is how you set up your fork for local development:

```
$ mkvirtualenv webchk
$ cd webchk/
$ pip install requirements_dev.txt
$ python setup.py develop
```

4. Create a branch for local development:

```
$ git checkout -b name-of-your-bugfix-or-feature
```

Now you can make your changes locally.

5. When you're done making changes, check that your changes pass flake8 and the tests, including testing other Python versions with tox:

```
$ flake8 webchk tests
$ python setup.py test or py.test
$ tox
```

To get flake8 and tox, just pip install them into your virtualenv.

6. Commit your changes and push your branch to GitHub:

```
$ git add .
$ git commit -m "Your detailed description of your changes."
$ git push origin name-of-your-bugfix-or-feature
```

7. Submit a pull request through the GitHub website.

## 4.3 Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring, and add the feature to the list in README.rst.
3. The pull request should work for Python 3.4, 3.5 and 3.6, and for PyPy. Check [https://travis-ci.org/amgedr/webchk/pull\\_requests](https://travis-ci.org/amgedr/webchk/pull_requests) and make sure that the tests pass for all supported Python versions.

## 4.4 Tips

To run a subset of tests:

```
$ python -m unittest test
```

### 5.1 Development Lead

- Amged Rustom <https://github.com/amgedr>

### 5.2 Contributors

None yet. Why not be the first?

### 6.1 1.0.4 (2020-08-29)

- Fix crash when an URL check times out
- Fix `-output` command-line option

### 6.2 1.0.3 (2020-07-10)

- Modify the Python versions tox tests
- Fix failing unit tests

### 6.3 1.0.2 (2020-05-08)

- Add Python versions 3.7 and 3.8 to the list of tested versions

### 6.4 1.0.1 (2020-05-08)

- Fixed: Parsing sitemaps enters an endless loop
- Fixed: Parsing a URL that does not exists exits with an unhandled exception

### 6.5 1.0.0 (2018-12-06)

- Linked to <http://codehill.com/projects/webchk/> instead of `readthedocs.io`

## **6.6 0.3.0 (2018-03-24)**

- Run each check in its own thread

## **6.7 0.2.1 (2017-12-19)**

- Fixed: Status code description not being displayed
- Improved PyPI and GitHub README

## **6.8 0.2.0 (2017-12-14)**

- Code refactoring
- Created setup.py

## CHAPTER 7

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`
